Liya Privacy Policy

Effective 4 November 2026.

Information handled

Liya uses an account identifier and session to connect to the service. You can register and sign in with an email address and password, or choose Sign in with Apple. Supabase processes the email address and authentication information needed to manage email accounts. Brevo processes the recipient's email address, authentication email content and delivery information to send account confirmation and password reset emails. If you choose Apple, Apple authenticates you and shares an account identifier and, where provided, an email address, which may be an Apple private relay address. Supabase processes the Apple authentication information to establish your Liya session. The service stores the account's coin balance and welcome-gift record, account profile and selected profile photo, saved mood entries and private thoughts, community profile, posts and attachments, comments, likes, follows, blocks, messages and attachments, AI chat messages and responses, and reports you choose to submit. When the app connects, the hosting provider may process connection information such as IP address and ordinary service logs. Local drafts remain on your device unless you choose to send them.

Earlier versions supported anonymous accounts. Existing anonymous sessions and their associated data may remain until the session or account is removed. Signing in with email or Apple does not automatically merge that data with a new account.

How information is used

The account and session support access to Liya, its content, community and your saved account information. Your community name and introduction, and any avatar you choose to share, are visible to other signed-in members. Posts, attachments and comments are visible to the community; messages and their attachments are available to their participants. People you block cannot interact with you through the community while the block is in place. Supabase provides authentication, database and file hosting for the service. Reports are stored, but a review service has not yet been configured. When you choose a coin pack, Apple supplies its App Store product information and processes any purchase. Liya verifies signed transaction information to deliver coins and retains transaction identifiers to prevent duplicate delivery.

AI conversations and third-party processing

If you choose to use Liya AI and give permission, Liya sends your message and a limited amount of recent AI conversation through Supabase to GroqCloud to generate a response. Supabase stores your conversation and forwards the request. Groq processes the text to produce the response and may process technical information needed to provide and secure its service. This AI feature sends text, not your photos, videos or audio. AI responses are automated, can be inaccurate, and are not professional or emergency support. Please consider carefully before sharing sensitive information.

Your AI conversation is stored with your Liya account. You can stop further AI requests by withdrawing permission in AI privacy settings; this does not recall a request already sent or erase saved conversation. Deleting your account removes the Liya account's stored AI conversation and consent records; it does not guarantee immediate deletion from a provider's systems. Service logs and

backups may be retained as needed for security, reliability and legal obligations.

Groq states that inference data is not retained by default, but inputs and outputs may be temporarily logged for troubleshooting or suspected abuse, generally for up to 30 days unless longer retention is required by law. Groq's published service agreement does not permit model training or fine-tuning on inputs or outputs without the customer's explicit permission or instruction. Retained customer data is stored in the United States according to Groq; processing and storage may involve a transfer outside your country. These provider statements do not mean that Liya itself has zero data retention. For further details see Groq customer data, Groq data processing addendum, Groq services agreement, and Supabase data processing addendum.

Voice and video calls

When you choose to start or answer a voice or video call, Liya requests access to your microphone and, for video calls, your camera. LiveKit Cloud provides the audio and video connection and may process account identifiers, call connection details, and the audio and video you choose to transmit. Call invitations and call status are stored by Supabase. If incoming-call notifications are enabled, a device push token, app identifier and push environment are used by Supabase and Apple to deliver incoming calls. If a call ends, its participants and call identifier may be retained temporarily to disconnect the call; completed cleanup records are removed after 24 hours, while unsuccessful cleanup remains available for retry. The app does not start a call without your action.

Photos and your choices

You can choose whether to select photos or videos using the system picker or take a photo using the camera. Selected items may be copied into the app's local storage and uploaded when you share a post or send a message; large videos may be compressed before upload. You may request deletion of your account in the app. This removes its cloud profile, posts, conversations, media and coin balance; local drafts remain on your device. A pseudonymous deletion receipt is retained to resolve an interrupted request; receipts older than 30 days are eligible for cleanup when another deletion is processed. Removing the app or clearing its data can remove local drafts and may make an anonymous account inaccessible. Take care when entering sensitive mood information or sharing content.

Security and contact

Access controls are used to protect account information, but no system can guarantee absolute security. If the service changes, this policy may be updated. The proposed support address is support@liya.com; it has not yet been confirmed or activated.
